

Company research laboratory

Our clients' requirements are changing, and we always try to meet these needs.

As part of the expansion of the machine park, we purchased a modern 3-component injector - for the production of a new squeegee model. As we have the appropriate technical facilities to carry out all work efficiently and precisely, we have set up a design team. Conceptual work among our qualified employees was strenuous and covered the areas of design, materials science and technological optimization. The research lasted from January 2013 to April 2017 - and concerned the introduction of a new 3-component squeegee. The works ended with the production of a new ToP Dry II squeegee model - and its solutions have been patented
